

Hi fellow students,

As you all are probably aware, the problem with plastic waste in our university is tremendous. Plastic bottles are the main source of this terrible issue, which puts shame on all of us. We as engineering students should pay special attention to sustainability, however our deeds prove the opposite.

As you all imagine this isn't an easy problem to solve, as it requires every one of us to change their bad habits and that's why the student council has come up with a proposal to allocate funds for a special program aimed to erase this problem.

The original plan was to supply students with free reusable water bottles, however, we later decided that it wouldn't solve the issue, as students would still probably buy bottled water. The second, more costly revision of our plan accounts for this problem, as after consultations with all of you, we have decided that additionally we would need to buy water filling stations, where students would be able to fill their bottles with freshly filtered water.

By now you probably realize that the second version is more expensive than the original, and in order for it to pass we need your votes supporting our proposal during the voting session organized by the student council.

I know that all of you are smart, environmentally aware people that take care of our planet, and so, I hope you will help us with this problem.

Best regards, Student Council.
